

for Microsoft® Office Communications Server

The Visualization Solution to Manage and Control the New Internet

Actiance Insight interfaces with Actiance's Unified Security Gateway and Vantage solutions to provide enterprise-class data visualization of user behavior, browsing patterns, and Web application usage trends. Ideal for managing enterprise networks which encompass multiple locations, the dynamic, multi-dimensional graphical interface provided by Actiance Insight provides complete visibility into Internet and real-time application usage that has not previously been possible with legacy reporting applications for Web security and data compliance.

This visibility is the crucial first step to managing the complex landscape of the New Internet, which includes social networking, instant messaging, and thousands of Web 2.0 applications. The information gleaned and mapped through Actiance Insight can in turn be assessed by management to discover trends around user productivity and Internet and real-time application usage. As a result, management is better able to establish and enforce policies.

AT A GLANCE

Actiance Insight provides powerful analytics, visualization, and reporting capabilities to better analyze the impact of the New Internet on the enterprise network, providing in-depth visibility into the usage of Web 2.0, unified communications, and collaboration applications; social networking sites; and general Web browsing.

KEY FEATURES

- Data assimilation from Actiance Unified Security Gateway and Vantage deployments at a single site or at multiple locations to provide trending and compliance reports over extended periods of time
- Graphical representation of usage statistics for more than 5,000 Internet applications
- Support for Microsoft OCS connectors, which enables data to be sent directly from OCS to Insight
- Support for social networks' transcripts
- Support for multi-LDAP
- Multi-dimensional tree mapping provides granular detail into network usage – by application, group, or user
- Powerful toolset enables the creation, scheduling, and export of fully customizable reports, pivot tables, and dynamic charts
- Role-based administrative access with the ability to generate reports across the entire network for all users or for just a specific set of groups or users
- Large library of commonly used detailed and summary reports and charts
- Intuitive wizard to facilitate custom reporting
